

## Magnetic Hematite

Hematite is an iron ore which can be magnetised through a process called Powder Metallurgy. This process combines natural Hematite and other minerals including copper, titanium and aluminium which can then be intensely

and permanently magnetised. Natural hematite cannot be permanently magnetised.

Magnetic Hematite looks very much like natural hematite, but it combines the healing properties of magnets with those of Hematite to produce a powerful pain reliever. It is said to maintain the natural charge of the nerve cells to increase the healing process. Magnetic Hematite is reputed to improve quality of sleep, relieve tension headaches and generally enhance physical energy and vitality.

The earliest written medical text, published in China around 2000 B.C. mentions the application of magnetic stones to correct health imbalances. The ancient Hindus in India believed that the sick should rest their body aligned with the north and south magnetic poles to relieve their pain.

DO NOT USE magnetic products if you are pregnant, or have electrical-medical implants. This jewellery is not intended for young children. Keep magnets away from electronic devices.
